1. INTRODUCTION

SPACER 1.1 is a Microsoft Windows based computer program for selecting and generating spacer models for inclusion into the THERM model of a fenestration system. This program is also known as THERM Spacer Library Program, because it contains library of over 1,000 spacers from all of the major spacer manufacturers in United States.

The program is designed to enable selection of spacers from the menu of available spacer manufacturers and to insert selected spacer assembly (i.e., spacer, sealants and desiccant) into THERM 5 computer program (LBNL 2002). THERM Spacer Library program is user-friendly tool and requires very short time to learn how to use it. This program is used in conjunction with THERM program and it can not generate spacers unless the THERM program is already installed.

For information about THERM program and to obtain a free copy, visit http://www.fenestration.com/therm.html. The site also contains information how to obtain technical support for THERM, WINDOW and RESFEN programs.

It should be noted that at this time, in version 1.1 of THERM Spacer Library program, data about primary and secondary sealant and their dimensions can not be changed inside the program because of the present inability of THERM 5.2 program to accept such data. It is expected that this will be available in the near future, at which time the update to the SPACER program will be released. Timely information about this integration will be posted on the web site (http://www.fenestration.com/spacer.html), and will be sent to the registered users of the program.

The future integration of the THERM Spacer Library Program is planned to include the following features:

- **Automatic launch of the program from within THERM 5**
  By clicking on “Draw Spacer” option in “Insert Glazing System” screen, the THERM Spacer Library program would be launched,

- **Default Size**
  Upon the selection of the spacer manufacturer and spacer product line, THERM Spacer Library program would automatically suggest applicable spacers,

- **Automatic dimensions**
  After the selection of spacer model, THERM Spacer Library will automatically adjust dimensions of sealants to fit the spacer void, which was already defined in THERM program,

- **Material selection option**
  Primary and secondary sealants and desiccant material will be available for selection within THERM Spacer Library program,

- **Automatic position of locator**
  Locator point will be automatically inserted at the appropriate location, so that spacer assembly can be imported directly into the spacer void of IGU.
2. INSTALLATION AND REGISTRATION

2.1. Hardware Requirements

First, make sure your computer system meets these specifications:

- A Pentium class computer with INTEL processor or better.
- At least 32 MB of random access memory (RAM). For optimal operation, 64 MB or more of RAM is preferable.
- Hard disk drive with at least 40 MB of available disk space.

2.2. Installation Procedure

The installation program is provided on a CD and the following are steps for installing the program:

1. Insert the installation CD into the CD-ROM drive on your computer.

2. Start the installation program by double-clicking on the SLSetup.exe. Alternatively, open a menu by right-clicking on the file SLSetup.exe and selecting Open.
   Note: only user with administrator privileges can install Therm Spacer Library on Windows NT Operating System family (Windows NT™, Windows 2000™, or Windows XP™).

3. A small Installation Wizard window will appear.

4. When the Installation Wizard window has finished, the Therm Spacer Library Welcome window will appear. Click the Next button to proceed with the installation, or cancel the installation by clicking on the Cancel button.
5. The **Destination Location** window is displayed next. The default directory where the program will be installed is C:\Program Files\LBNL\Spacer Library. If you want to install the program in another directory, you can use **Browse** button to specify the location. When you are satisfied with the **Destination Folder**, press the **Next** button to continue with installation.
6. Next displayed window is **Backup Replaced Files** window where you have possibility to choose whether to create copies of all files replaced during the program installation or not. If you choose to create copies, default destination directory for backup files is `C:\Program Files\LBNL\Spacer Library\BACKUP` and there is possibility to change it by clicking on button **Browse**.

![Figure 2-4: The Backup Replaced Files window](image)

7. The **Select Components** window is displayed next. There is a possibility to choose which Therm Spacer Library components you want to install. Required disk space for each component is also displayed there.

![Figure 2-5: The Select Components window](image)
8. When the **Select Components** window has finished, the **Select Program Manager Group** window appears. There you can choose which Program Manager group to add Therm Spacer Library icons.

![Figure 2-6: The Select Program Manager Group window](image)

9. When previous steps are completed, the **Start Installation** window appears. Any of previous settings can be changed by clicking the **Back** button, or accepted by clicking the **Next** button.

![Figure 2-7: The Start Installation window](image)
10. The **Password** window is displayed next. Since Therm Spacer Library installation is protected, it is necessary to enter password into the appropriate field. After entering it, press the **OK** button in order to proceed with the installation.

![Password window](image)

**Figure 2-8: The Password window**

11. Then, the installation program will install Therm Spacer Library and show bars with the installation status. You can stop it by clicking the **Cancel** button.

![Installation window](image)

**Figure 2-9: The Therm Spacer Library Installation window**
12. When Therm Spacer Library is successfully installed, the final installation window will appear.

![Figure 2-10: The Installation Finished window](image)

After the setup program finishes installation, shortcut for Therm Spacer Library.exe will be automatically put on your desktop. To run the Therm Spacer Library use its icon on the Programs menu accessed from the Start button, or the shortcut from the desktop.

### 2.3. Registration

To use this software user MUST register it. The software must be registered within fifteen days of installation, or the following screen will remind the user that the license has expired.

![Figure 2-11: Machine ID](image)

MachineID will correspond to user’s computer system ID, which is obtained automatically by the SPACER program. This ID should be sent to spacer@fenestration.com to complete software registration. The instructions how to unlock this product with full-time license will be sent to the user.

**Please note** that this license can be used only on machine where above MachineID was generated! It should also be noted that the program can be moved from one machine to another, but for each installation, the user will have to contact Carli, Inc. to get the new license key. For multi-license purchases, each installation will have to be registered and separate license key obtained.
3. QUICK START

This chapter is intended to provide a summary of Therm Spacer Library components and its functions. The Therm Spacer Library main screen for defining a complete spacer assembly, shown in Figure 3-1, has three main areas:

1. Spacer Selection
2. Default Specifications
3. Custom Specifications

![Figure 3-1: Therm Spacer Library Main Screen](image)

The first area – **Spacer Selection** is intended for defining desired spacer assembly and consists of three pull-down lists:

   a. Selection of a manufacturer
   b. Selection of a spacer category
   c. Selection of a spacer model

After the choice of particular spacer is made from the above three steps, the preview of spacer geometry is displayed at the right side of the main screen, as shown in Figure 3-1.

The second area of the program screen, titled **Default Specifications**, displays spacer dimensions and material, as well as default materials for primary and secondary sealants. It should be noted that spacer dimensions and material could not be changed because they are fixed for each spacer model.
The third area – **Custom Specifications** contains information about primary and secondary sealant and their dimensions and this information can be changed as per actual spacer installation in each IGU. However, at this time, in version 1.0 of THERM Spacer Library program, this data cannot be changed inside the program because of the lack of proper interface with THERM5 program. To change sealant dimensions and materials, after the spacer is inserted in THERM5 program, using the THERM5 tools these parameters can be easily changed. The dimensions and material of the spacer itself is not allowed to be changed, because that would misrepresent actual spacer configuration.

The lowest section of the main screen contains buttons for manipulating Therm Spacer Library program and spacer models, as well as for displaying data about program version. The **Insert** button is used for inserting chosen spacer in THERM5, while the **Close** button is used to exit Therm Spacer Library program.

Finally, the **About** button opens dialog-box, shown in Figure 3-2, with information about program version and author. This box also contains information about user, user’s organization, machine ID and information about trial days that are left before license expire.

4. PROGRAM USE

This chapter provides summary of steps needed for including spacer into THERM fenestration product. The primary steps for inserting spacer into the THERM fenestration model are:

- Define desired spacer assembly dimensions using tape measure in THERM5, after the glazing has been inserted from the glazing library into the THERM model.

![Image of spacer voids ready for insertion of spacer from THERM Spacer Library](image)

Figure 4-1: Spacer voids ready for insertion of spacer from THERM Spacer Library

- Choose appropriate spacer assembly using the methodology described in chapter 3.

- Draw locator in the **upper left corner** (for the glazing system facing Up) of the spacer void (see Figure 4-2) and simply press insert button on the Spacer Library main screen.
Spacer will be automatically inserted in the current THERM 5 project attaching its upper left corner to the project’s Locator. Figure 4-3 shows the spacer inserted in glazing facing Up.

At the same time, chosen spacer is inserted, with the Locator placed at its upper left corner, in the newly opened THERM file, shown in Figure 4-4.
For windows with glazing facing down, it will be necessary to Flip (Draw/Flip/Vertical) the spacer in the opened THERM 5 file (shown in Figure 4-4), draw locator in the lower left corner of the spacer model and press copy (Edit/Copy). In the fenestration model, draw locator in the lower left corner of the spacer void, and press Paste (Edit/Paste). Figure 4-5 shows both spacers inserted into the meeting rail cross section.

Figure 4-5: Spacers inserted in both glazing systems of a meeting rail
Finally, for spacers that have part of glazing cavity space, will need to have this material changed from the default to the material that has the same conductivity as glazing cavity (See Figure 4-6).

Figure 4-6: Continuation of the glazing cavity space into the spacer changed from default to actual glazing cavity effective conductivity, $k_{eff}$
